
M3 | Mount Pleasant

Questions for the next engagement phase

VibesAgent · Public-source sample · September 4, 2026

What would people living and working near 111 East 5th Avenue need to understand about this proposal, and which concerns would remain? This sample separates the record, proponent claims and questions for original research. No community interviews have been conducted for this sample.

Established in the public record

The application proposes data storage in an existing commercial building and below-grade parking areas, plus a ground-level restaurant. The City says further engagement will begin after the election; it gives no confirmed replacement date. [City project page](#)

On July 21, Council reconsidered its earlier hearing referral and returned the report to staff for further consultation. That decision did not approve the rezoning. [Council minutes, pp. 63-64](#)

The June 30 staff report records approximately 579 submissions, including support and concerns. It records an applicant-anticipated M3 load of up to 40 MW, not a confirmed electricity allocation. Staff recommend requiring a viable heat-recovery pathway to the City's False Creek Neighbourhood Energy Utility before enactment. These are recommendations, not conditions adopted through the referral-back decision or evidence of delivered heating. [Staff report, pp. 6, 14-16](#)

Proponent claims to examine

TELUS's May 11 announcement describes water savings and recovered heat for its Vancouver facilities collectively, and forecasts power capacity, economic value and jobs for the broader three-facility BC cluster. These are company projections; the announcement does not assign those benefits to M3 alone. [TELUS announcement](#)

What the pilot would investigate

- Which concerns are specific to M3's location and operation, and which concern the wider AI industry?
- What site-specific evidence do participants want on electricity, water, noise, heat recovery and local jobs?
- Which accountable commitments would they find useful, and where would disagreement persist?
- Which perspectives did recruitment miss, and whose experience should be heard next?

Interviews would document reasoning and experience. Technical claims would need separate confirmation from the responsible parties. The findings would preserve disagreement and disclose recruitment limits.

Proposed pilot

CAD 10,000 · Three weeks from kickoff · One project

Public-source baseline, issue-and-claim ledger, 20-30 consented qualitative interviews with residents, businesses and workers, findings, and a briefing. Participants would know who commissioned the work; the buyer would receive analysis without participant identities. This is a proposal for discussion. Findings would not be a representative poll or a promise of approval.
